SUBANG JAYA: Digi Telecommunications Sdn Bhd (Digi) has launched a Wi-Fi solution - iFleet Wi-Fi, to enable bus and train companies as well as other land transport operators to offer seamless connectivity to commuters.

This is the local telecommunications provider's first subscription-based transport connectivity solution which looks at improving onboard passenger experience by helping to transform travel time into productive time.

The new service was piloted with several customers and most recently in Sarawak with Bus Kuching - an electric bus service in the state, and was well received by its passengers thanks to the provided connectivity during their daily commute.

Digi's Chief Digital Officer, Praveen Rajan said that as public Wi-Fi availability grows, passengers increasingly expect to be in constant communication with their work or social networks, wherever they are.

"Based on a survey done by Malaysian Communications and Multimedia Commission (MCMC) in 2018, 68.1% of Malaysians use the Internet when they were on-the-go.

As such, the opportunity to increase productivity while travelling is making public and commercial transport usage more attractive, and the industry has reached the point where Wi-Fi on transit is now deemed to be an essential offering for land transport operators," she said.

With iFleet Wi-Fi, land transport operators can reduce their costs by benefitting from minimal upfront investment – the simple subscription service provides a much lower cost for the Wi-Fi service that is typically very expensive for commercial vehicles.

Commercial vehicle and land transport operating companies can also choose to customise their brand message on the Wi-Fi landing page to further personalise the service to their passengers.

This also allows the operators to serve ads on their landing page to further monetise the service.

Given the increasing use of Wi-Fi enabled mobile devices such as smartphones and tablets, Wi-Fi can be effective to gather passenger data and insights in which land transport operators can leverage to improve their services.

"With iFleet Wi-Fi, land transport operators get the best of both worlds – not only do they get to provide their passengers with quality service, but they also get to save on their operating cost. Passenger data and insights are also helpful to meet passengers' expectations accordingly – ultimately we want to provide a service that is of value to our customers and will help their businesses grow," explained Praveen.

iFleet Wi-Fi provides stable and fast connectivity via Digi's 4G-LTE network.

The service supports multiple concurrent users and cross-border connectivity in Singapore and Thailand.
